First Degree Burn or Superficial Burn

- The first-degree burn or the Superficial Burn affects only the epidermis. It is commonly red and dry, plus painful when touched.

Second Degree Burn

- The second-degree burn includes two different kinds- one is the Superficial Partial Thickness burn. In this case, the entire epidermis and upper layer of dermis get affected. The other kind of Second-Degree burn is Deep Partial Thickness burn which results in the damage of the entire epidermis along with most of the dermal layers. These burns are characterized by pinkish-red blisters, moist appearance causing significant pain.

Third Degree Burn or Full Thickness Burn

- The Third-Degree Burn affects the epidermis, dermis and even the subcutaneous tissues. The burns are black, gray and white in color, which is dry and leathery in their appearance.
